I am just starting out on React JS. I am creating a card matching game and I have three cards stacked in a page. When the user clicks on the card I want to display its details and the details of the next and the previous cards. I have three cards initially, when the user clicks on any card I am updating the state. I update state and then on the next click I am updating the state again. Please explain what is the need for update the state in this code. I am just confused. This is the code in question class Cards extends React.Component { constructor(props){ super(props); this.state={ value1: "", value2: "", value3: "", value4: "", value5: "", value6: "", value7: "", value8: "", value9: "", value10: "", value11: "", value12: "" } this.handleChange = this.handleChange.bind(this); } handleChange(event) { this.setState({ [event.target.id]: event.target.value }); } render() { const { value1, value2, value3, value4, value5, value6, value7, value8, value
